Stable Money— FDs & Bonds (Digital Investment Platform)

About

Stable Money is India's first digital fixed-deposit marketplace, founded in 2022 by Saurabh Jain and Harish Reddy. It helps users discover, compare, and book fixed deposits and other fixed-return products digitally, without needing to open a savings account with each individual bank.

- Users: 30 lakh+
- AUM: ₹3,000+ crore across FDs and bonds
- Coverage: 200+ banks and NBFCs for FD comparison

The platform's core value proposition is convenience and choice: instead of manually checking rates across banks, users compare and book the best available FD rate in one place, digitally.

Mission Statement

Stable Money's mission is to make fixed-return investing simple, digital, and accessible for Indian users who want predictable wealth-building without high market risk. The deeper ambition behind this mission is behavioural, not just transactional: turning what is typically a one-time FD rate comparison into a repeat fixed-income investing habit.

In other words, Stable Money doesn't just want to be the place where someone books their first FD or a tool to compare returns— it wants to be the platform users return to every time they have money to park safely, whether in another FD, a Recurring Deposit, or a Bond and grow mutually.

Target Audience

Stable Money's core audience is first-time and risk-averse investors, with a growing strategic focus on Tier 2/3 India.

- First-time investors who are new to formal investing and default to what feels safest — an FD — over market-linked products like mutual funds or stocks.
- Risk-averse investors who prioritize predictable, guaranteed returns and lower volatility over higher but uncertain gains.

- Users who understand FDs intuitively, since fixed deposits are a familiar, trusted instrument across Indian households, unlike newer market-linked products.
 - An expanding base in Tier 2 and Tier 3 cities, where digital-first, branch-free access to competitive FD rates is a meaningful upgrade over traditional banking relationships.
-

Problem Statement

Brief

Stable Money's core problem is retention, not acquisition. Users trust the platform enough to book one FD, but that trust isn't converting into repeat fixed-income investing. Today, 4 out of 5 first-time FD investors never come back within 90 days — turning what should be an ongoing investing relationship into a single, one-off transaction.

- **Current State:** 90-day repeat investment rate is 20%.
 - **Target:** Raise it to 35% within 6 months.
 - **Core Risk:** Without a fix, Stable Money stays a one-time rate-comparison tool, not a habit-forming investing platform.
-

Initial hypothesis

The 90-day drop-off isn't only a product or trust problem. It's rooted in who lands on Stable Money, why they came, and what happens right after that need is met.

- **Generational Shift in Investing Psychology:** Younger, digitally-native investors are increasingly drawn to SIPs, ETFs, and stocks over traditional fixed-income products like RDs and Bonds. Even a happy FD customer doesn't automatically think of RD or Bonds as their next move. Their attention, and their money, is drifting toward market-linked options instead.
- **FD as an Entry Product, Not a Loyalty Product:** An FD is close to a financial rite of passage. Most investors want at least one by their 30s as a safety net, and Stable Money's specialization in FD comparison is exactly why it pulls in this large crowd. But for most of them, an FD is a one-time checkbox need, not the start of an ongoing relationship. The real challenge is converting FD-seekers into users of Stable Money's other fixed-income products.
- **A Comparison Tool, Not Yet a Habit-Forming Platform:** Not many platforms let users compare this many fixed-income options (FDs, Bonds, and more) in one place, which is exactly why people land on Stable Money to begin with. But once their FD need is met, there's currently nothing keeping them engaged or bringing them back. The app functions today as a utility, not a retained platform.

These three patterns point to the same underlying gap: Stable Money is very good at earning a user's first FD, but has no built-in mechanism to carry that trust forward into the next investment. Closing that gap, turning a one-time comparison visit into an ongoing investing relationship, is the core problem this project sets out to solve.

Market & User Research

User Research

My research looked at this from two angles: first, understanding how everyday fixed-income investors think about reinvesting in general, and then going deeper with people who already use Stable Money to see how that plays out in real life. Below I summarized and pointed out the key pointers from both the sources (Survey & User interviews), Here's what surfaced from each:

Survey

- **Confusion beats distrust:** 55.6% say the top reason someone doesn't reinvest within 90 days is being unsure what to invest in next. Forgetting and losing trust got zero votes between them.
- **Rate over reminders:** 50% reinvest for a better interest rate, 40% for platform trust, and 0% cite reminders as the deciding factor.
- **RD is familiar, Bonds aren't:** 80% understand RDs well enough to invest, only 30% say the same for Bonds.
- **Reactive, not planned:** only 20% already know what they'll do when an FD matures; most decide only once it happens.

Survey Link: <https://www.surveymonkey.com/r/PBMLT9F>

Survey Analysis Dashboard: https://www.surveymonkey.com/stories/SM-QeRmJ6MSP0oSayEhNRqTTg_3D_3D/

User Interviews

- **Users want to be told what's next:** two of the three interviewees, unprompted, said they'd reinvest if the app proactively suggested where to put their money once an FD matures, closely echoing the survey's top finding.
- **Rate still drives the decision:** multiple interviewees said a better return, more than trust or convenience, is what would actually bring them back.
- **Spare money doesn't wait around:** one interviewee actively splits spare money between stocks and betting apps, another diversifies across risk levels on a set plan, while a third simply leaves it idle in a bank account when not investing through Stable Money, pointing to at least two distinct user types to design for.
- **The convenience that hooks users doesn't retain them:** every interviewee praised the same thing, easy and uncluttered FD comparison, as the reason they chose Stable Money, but none named it as a reason they'd come back a second time.

Interview Screenshots: https://trusting-tote-e40.notion.site/Interview-Screenshots-f1c65cbc430341848f35e5e68cae97e4?source=copy_link

Together, the survey and interviews tell the same story from two different angles: users trust Stable Money enough to book once, sometimes twice, but nothing today tells them what a good next move looks like or when to make it. Closing that gap, rather than just fixing trust or adding reminders on their own, is what will move the 90-day repeat rate.

Market and Behavioural Patterns

Stable Money’s repeat-investment problem is shaped by two forces at the same time: users have different reasons for opening an FD, and the broader investment market is steadily training them to make recurring, digital, and market-linked investment decisions.

The following three personas capture the most relevant user behaviours. The market section then shows why these behaviours matter now.

1. The Safety-First Depositor

This user treats an FD as a dependable place to protect surplus money. They prefer certainty over higher but uncertain returns, and usually make a larger one-time investment.

Attribute	Behaviour pattern
Typical profile	35–55, salaried or self-employed, family financial responsibilities
Core need	Capital safety and assured interest
Preferred products	FD, RD, PPF/EPF, savings account, gold, insurance
FD usage	One larger FD for a known period
Main concern	Bank credibility, deposit safety, and liquidity
Return trigger	Maturity, bonus, business surplus, or a specific family goal
Risk comfort	Low

Behavioural insight

After the first FD is booked, this user often sees the task as complete. Unless there is new surplus money, a maturing deposit, or a clear short-term goal, there is little reason for them to reopen the app within 90 days.

For this persona, the second investment is not a natural continuation of the first. It needs a distinct financial reason.

2. The Digital Diversifier

This user does not rely on a single investment type or a single finance app. They want part of their money to remain safe while using the rest for liquidity or potentially better returns.

Attribute	Behaviour pattern
Typical profile	25–40, salaried professional or digitally active self-employed user
Core need	Balance safety, flexibility, and long-term growth
Preferred products	FD, SIP, index fund, stocks, liquid fund, gold
FD usage	Starts small, compares rates, and spreads money across products or banks
Main concern	Missing better returns or locking money for too long
Return trigger	Salary credit, attractive rates, market movements, or a new goal
Risk comfort	Moderate

Behavioural insight

The first FD addresses this user's safety requirement, but it does not own their full wallet. When the next surplus arrives, the user compares an FD against an SIP, stock purchase, liquid fund, or another bank's rate.

For this persona, inactivity may not reflect poor satisfaction. It often means the next investment decision happened on another platform.

3. The Young Habit Builder

This user is at the start of their investment journey. They invest in small amounts, learn through digital content, and are more likely to respond to regular reminders, visible progress, and peer behaviour.

Attribute	Behaviour pattern
Typical profile	21–30, first-time or early-stage investor, often mobile-first

Attribute	Behaviour pattern
Core need	Start early, build wealth, and retain flexibility
Preferred products	SIP, stocks, index funds, small FDs, RD, gold
FD usage	One-time safety experiment, short-term parking, or goal-based saving
Main concern	Ease of use, minimum amount, returns, and liquidity
Return trigger	Salary day, market news, app notification, social content, peer recommendation
Risk comfort	Moderate but still developing

Behavioural insight

For this user, an FD can feel inactive after booking. It does not offer the monthly action, visible progress, or frequent feedback that they get from SIP and stock-investing apps.

Without a clear next milestone, their attention naturally shifts towards products that create recurring investment loops.

Market Patterns and Analysis

The market is not moving away from FDs completely. It is increasingly diversifying around them, while digital and recurring investing become more familiar.

Evidence	Latest figure	Why it matters
Bank deposits as share of household financial savings	More than 58% in FY12 to about 35% in FY25	Deposits remain large, but their share of new household savings has declined. [thehindubusinessline]
Equity and mutual funds as share of household financial savings	About 2% in FY12 to 15.2% in FY25	A structural movement toward market-linked products is underway. [thehindubusinessline]
Contributing SIP accounts	9.72 crore in March 2026	Recurring investing has become a mass habit. [economictimes][hindi.etnownews]

Evidence	Latest figure	Why it matters
Monthly SIP contributions	₹32,087 crore in March 2026	Investors are committing money monthly at record scale. [angelone] [economictimes]
Securities-market participation	9.5% of Indian households	Most households are still outside market products, keeping the potential FD user base substantial. [economictimes.indiatimes] [moneycontrol]
Household preference	Nearly 80% prefer capital preservation over high returns	Safety remains a dominant need, even as more people experiment with markets. [economictimes.indiatimes]
Urban versus rural market participation	15% urban versus 6% rural	Adoption is stronger in cities, but creates room to grow trusted digital products beyond metros. [economictimes.indiatimes] [thehindubusinessline]

- Deposits remain important, but they no longer capture the same proportion of new savings as before.
- SIPs create a recurring monthly behaviour, while FDs generally create a one-time transaction followed by a long silent period.
- Young and digitally active users are more likely to use multiple finance apps, increasing competition for every next investment.
- A large majority still value safety first, so the opportunity is not to replace FDs with riskier products, but to keep safe-money decisions active and relevant.
- The user's next investment is shaped by timing, surplus cash, goals, trust, and product visibility, not only by whether the first FD experience was satisfactory.

Significance of these Patterns

- The Safety-First Depositor needs a reason to return because their natural behaviour is to wait until maturity or until fresh surplus cash appears.
- The Digital Diversifier needs Stable Money to remain relevant when they compare an FD with other ways of using their next available amount.

- The Young Habit Builder needs a safe-investing experience that feels progressive and active rather than completed after one transaction.
- Across all three groups, the core retention gap is the period between the first FD booking and the next financial trigger. The product challenge is therefore behavioural, turning a one-time FD booking into an ongoing safe-money relationship

India remains a safety-conscious savings market, which protects the long-term relevance of FDs. At the same time, recurring investing has changed what users expect from a finance app: timely prompts, visible progress, and a clear next step. Stable Money's ability to earn the next investment will depend on how effectively it identifies each user's trigger, makes the next safe-money action feel relevant, and stays present before that money is allocated elsewhere.

Competitive Analysis

Stable Money sits in the digital fixed-income category, competing most directly with Wint Wealth and Jiraaf, while facing a broader engagement threat from investing ecosystems such as smallcase. The key benchmark is not only product availability. It is whether each platform gives users a reason to return after the first investment.

Market context

Signal	What it shows
Stable Money has facilitated ₹5,000 crore+ in fixed-income investments and reported roughly ₹5,000 crore AUM in early 2026	It has already built meaningful scale in FD-led investing.
Stable Money grew FD assets to ₹4,000 crore across 1.25 lakh deposits in just over two years	Strong acquisition and FD demand, but repeat behaviour is the central product challenge.
Wint Wealth reports ₹6,000 crore+ AUM, 9 lakh+ platform users, 3 lakh+ registered retail investors , and ₹8,000 crore+ facilitated	Wint has more maturity in retail fixed-income engagement and a larger user community.
Wint states that repeat customers drive about 80% of revenue	The strongest available signal that repeat investing, rather than only acquisition, is central to its business model.

Competitor Comparison

Platform	Core offering	What makes it distinct	Proof of traction	How it retains users
Stable Money	FDs, RDs, bonds, gold	Simple comparison-led FD journey; 200+ FD products across roughly 9 partner banks and 3 NBFCs	₹4,000 crore FD AUM and 1.25 lakh deposits by late 2025; ₹5,000 crore+ fixed-income investments reported in early 2026	Rate comparison, investment tracking, digital booking, maturity and withdrawal support. The engagement gap is between booking and maturity.
		Makes retail bonds accessible through curated products, education, and portfolio diversification	₹6,000 crore+ AUM, 9 lakh+ users, 3 lakh+ registered investors, ₹8,000 crore+ facilitated	
Wint Wealth	Corporate bonds, NCDs, securitised debt, fixed-income products			New bond inventory, regular investment discovery, diversification, repayments, and fixed-income content. Repeat customers reportedly contribute ~80% of revenue.
Jiraaf	Government and corporate bonds, fixed-income products	Yield-focused bond discovery for users moving beyond FDs	Public platform-scale metrics are not reliably available, so no user or AUM comparison should be claimed	New issues, coupon payouts, maturity schedules, and yield comparison create ongoing portfolio events. Jiraaf lists detailed issuer, coupon, maturity, and rating information for individual bonds.
smallcase	Equity portfolios and broader investing ecosystem,	High-frequency investment ecosystem rather than an FD-first proposition	Its advantage is established engagement around market investing rather	Portfolio updates, market movements, new investment ideas, and cross-product allocation create frequent app opens. It is among platforms

Platform	Core offering	What makes it distinct	Proof of traction	How it retains users
	including digital FDs		than public FD-specific scale	participating in India's growing digital-FD category.

Differentiation at a Glance

Dimension	Stable Money	Wint Wealth	Jiraaf	smallcase
Best for	Simple, safe FD and RD investing	Investors seeking FD-plus fixed-income options	Bond investors comparing yield and tenure	Users who want investing in one ecosystem
Core trust lever	Bank FD familiarity and deposit insurance	Curated bonds, education, and product evaluation	Bond-level information and yield visibility	Established investing ecosystem
Product complexity	Low	Medium	Medium to high	High
Natural return frequency	Low	Medium	Medium	High
Main retention driver	FD maturity or fresh surplus	New bond opportunities and diversification	Coupon, maturity, and new-issue events	Frequent market and portfolio activity
Main weakness	Few reasons to return after booking	Bond-risk education required	More complex for first-time fixed-income users	Less safety-focused, higher product noise

What the Data Means

- **Stable Money's strength is simplicity at scale.** It has already reached about ₹4,000 crore of FD assets across 1.25 lakh deposits, which validates the need for a digital, rate-comparison-led FD experience.
- **Wint Wealth's strength is repeatable discovery.** Its reported scale, including 9 lakh+ users and a repeat-customer contribution of about 80% of revenue, suggests that new

instruments, education, and diversification can turn fixed income into an active portfolio category.

- **Jiraaf competes for the higher-yield conservative investor.** It can pull users away after their first FD when they begin searching for better returns with defined tenure and periodic payouts.
- **smallcase competes for attention.** Even if a user wants an FD, a multi-product investing app has more frequent triggers to capture their next available surplus.

Implication for Stable Money

Stable Money should not try to match bond-platform complexity or equity-app frequency. Its opportunity is to create safe, simple reasons to return before FD maturity.

The competitive gap is clear: competitors retain users through more choices, portfolio events, or high-frequency market engagement. Stable Money can retain its **safety-first advantage by making the user's next safe-money decision easier, more timely, and visibly connected to the first FD.**

Problem Discovery & Impact Assessment

User Pain Points- key insights

Feedback collected from app reviews, forums, and review platforms points to a consistent set of behaviours among first-time FD investors at Stable Money. Therefore, here are some key insights from the raw pain point points and data I have gathered

- **Exit is harder than entry:** Booking a first FD is described as smooth, while withdrawing funds or tracking a redemption is slow and unclear, which discourages committing more money to the platform.
- **Bad experiences lead to named competitor switches:** Several users report moving their next investment to a specific competitor rather than staying and trying again with Stable Money.
- **Trust questions surface before any problem occurs:** Users proactively question platform safety and the logic of parking money with smaller finance banks, independent of having had a bad experience themselves.
- **Support quality drops once the first product is active:** Most support complaints come from users already holding an FD or FD-linked product, not from people still deciding whether to invest for the first time.
- **Adjacent products underperform the core FD experience:** Bonds and the FD-linked credit card, the two offerings closest to a second investment, show more processing delays and technical issues than FD booking itself.
- **Quality decline can be gradual:** At least one long-time user describes the experience worsening over several months rather than through a single incident.
- **Satisfied users point to a specific growth lever:** A subset of reviews name more bank options and higher interest rates as the exact condition that would lead them to invest further.

Pain Point List:

https://1drv.ms/x/c/405e9216b0f4b746/IQDpwqhZVwa0Rb0DC8Posi6JASHzMVe_zxZ3JDul81yITOQ?e=kkkW2d

Persona Based Problem Statements

Understanding why first-time FD investors don't return is clearer through specific people than through aggregate numbers. Each persona below represents a distinct type of investor, along with the particular barrier standing between their first FD and their second.

Therefore, I made Problem statements with 4 different personas to clearly differentiate and identify the

Persona 1: Ananya Verma

Age: 34

Location: Pune

Investor Type: First-time FD investor, salaried, low risk appetite

Problem Statement: Ananya booked one FD to test whether a digital platform could be trusted with her money, treating it as part of her emergency fund rather than a long-term bet. Her hesitation is not about the FD itself but about the uncertainty around getting her money out quickly and without friction if she ever needed to, and that uncertainty is enough to stop her from booking a second one.

Persona 2: Rohit Mehta

Age: 41

Location: Mumbai

Investor Type: Existing FD and FD-card holder, moderate income

Problem Statement: Rohit already holds an FD and a linked credit card, and was ready to add a second investment. A support issue on his existing product went unresolved for days, and that experience made him question whether Stable Money would be responsive if something went wrong with a larger commitment. He has not left the platform, but he has stopped adding to it.

Persona 3: Priya Nair

Age: 27

Location: Bengaluru

Investor Type: Young, digital-native, multi-app investor

Problem Statement: Priya manages her money across several apps and judges each one the same way she judges any app, on how smooth the daily experience feels. Minor lag, bugs, or unannounced changes are enough to push her attention and her next investment toward whichever platform currently feels the most reliable, and Stable Money has not yet earned that default spot.

Persona 4: Suresh Iyer

Age: 52

Location: Coimbatore

Investor Type: Traditional saver, new to digital FD platforms

Problem Statement: Suresh grew up trusting nationalized bank FDs and is new to booking fixed deposits through an app rather than a branch. Before he moves a larger amount, he wants clear, verifiable proof that his money in a smaller finance bank is genuinely as safe as it would be in a traditional bank, and he is not finding that reassurance inside the app today.

Ideal Persona for Stable Money: Of the four, Suresh best represents Stable Money's ideal investor profile. The platform's core audience skews toward first-time, risk-averse investors with a growing focus on smaller towns and cities, which maps closely to who Suresh is and how he thinks. He is also the persona whose barrier, verifiable safety, is the most directly solvable through product design rather than through infrastructure or support-org changes. Solving trust for someone like Suresh has the widest reach, since it removes the same hesitation for a large share of Stable Money's core audience, not just a narrow user segment.

Persona Table

Persona	Age	Location	Investor Type
Ananya Verma	34	Pune	First-time FD investor, salaried, low risk appetite
Rohit Mehta	41	Mumbai	Existing FD and FD-card holder, moderate income
Priya Nair	27	Bengaluru	Young, digital-native, multi-app investor
Suresh Iyer	52	Coimbatore	Traditional saver, new to digital FD platforms

Pre-Business Impact Analysis

Each problem statement carries a cost that is already visible in Stable Money's own numbers today, independent of any future target.

Where Stable Money Stands

Metric	Value
Registered users	30 lakh+
AUM across FDs and bonds	₹3,000+ crore
Partner banks and NBFCs	200+
Latest funding	\$20M Series B, led by Fundamentum Partnership
Average AUM per registered user	~₹10,000
Play Store rating	4.7 out of 5
Current 90-day repeat investment rate, first-time FD investors	20%

What Each Barrier Is Costing Today

Persona / Barrier	Metric Moved	Explanation	Impact on Stable Money
Ananya, exit and redemption friction	Churn Rate: 80%	Percentage of first-time investors who stop transacting with Stable Money within 90 days.	Loses the trust needed to convert a first FD into a second, larger one; capital stays parked instead of compounding.
Rohit, post-booking support breakdown	Net Promoter Score (NPS): Suppressed	Measures how likely a customer is to recommend the product, based on satisfaction and loyalty after their experience.	Loses customers at the exact moment they were ready to reinvest, since poor post-booking support erodes the loyalty a second commitment needs.

Persona / Barrier	Metric Moved	Explanation	Impact on Stable Money
Priya, reliability and performance decay	Crash-Free Session Rate: Degraded	Percentage of app sessions completed without a crash, freeze, or technical failure.	Loses reliability in the exact products, bonds and the FD-card, meant to build a repeat-investing habit, pushing users toward more stable competitor apps.
Suresh, trust verification gap	Conversion Rate, First to Second Investment: Suppressed	Percentage of users who move from considering a second investment to actually completing it.	Loses its own core target segment, risk-averse first-time investors, the exact audience the product is built for.

Underlying Economics

- **Trust gap, not a usage gap:** fintech apps typically retain 65% of users by day 90, Stable Money's repeat investment rate is 20%, so people are opening the app, just not investing again.
 - **One shot per user:** FD tenures lock capital for a fixed period, ruling out the mid-cycle win-back campaigns other apps rely on.
 - **Repeat behavior already carries revenue:** FY25 gross revenue of roughly ₹104 crore leaned largely on bond trading over FD commissions.
 - **Non-returning users likely never turn a profit:** wealthtech apps in India typically take 18 to 36 months just to earn back what they spent acquiring a customer. If someone invests once and never comes back, Stable Money likely never recovers that acquisition cost at all, so instead of becoming a profitable customer, that user ends up costing the business more than they ever bring in.
-

Primary Barrier to Repeat Investing

Of the four barriers surfaced through the personas, one carries more weight than the others in explaining why the 90-day repeat investment rate sits where it does.

Barrier	When It Surfaces	Investor Reach	Fit with Core Segment
Trust and safety doubt	Before any negative experience occurs	Broad, reflects the cautious mindset most Indian investors already hold	Strong, mirrors Stable Money's core investor profile directly
Exit and redemption friction	Largely before a negative experience, driven by liquidity concerns	Broad, this concern exists independent of an actual bad experience	Strong
Post-booking support breakdown	Only after a negative experience occurs	Narrower, limited to investors who encounter a support issue	Moderate
Reliability and performance decay	Only after a negative experience occurs	Narrower, concentrated among users of bonds or the FD-linked card	Moderate

Primary Barrier: Trust and Safety Doubt

- It is the only one of the four that shows up before anything goes wrong. A user does not need a bad support call or a buggy session to hesitate, the doubt is already there the moment they consider investing more, which means it touches the entire first-time investor base, not just the subset who happen to run into a problem.
- It lines up directly with who Stable Money is actually built for. The platform's own core segment is first-time, risk-averse investors, and that caution is not a fringe trait, it reflects how most Indian households already approach money.
- The other three barriers are really this same doubt wearing different clothes. Exit friction is a lack of trust in getting money back, support breakdown is a lack of trust in the platform's follow-through, and reliability decay is a lack of trust in its competence. Fixing trust at the root has pull across all three, while fixing any single one of them still leaves the underlying doubt standing.

- It is also the barrier sitting between Stable Money and its own ideal investor, the same risk-averse, first-time profile the product already exists to serve, so closing this gap compounds rather than just adding a narrow fix.

The other three barriers are not any less real, they are simply the situations most likely to turn a quiet trust doubt into an active decision to walk away. Trust is what occupies the room before any of that happens, which is why it carries the strongest pull on the number this entire strategy is trying to move.

Solution Ideation and Prioritization

Solution Brainstorming

Each of the four barriers points toward a different kind of fix, some are about what's shown and when, others are about how the platform responds once something goes wrong. The ideas below are grouped by persona, with one or two features as solution under each, ahead of scoring and prioritization.

Ananya, exit and redemption friction

- **Redemption terms shown upfront, in plain sight:** At the moment of booking, the specific details that matter most for exit, redemption speed, any conditions, are pulled out of the fine print and shown in a short, highlighted format the user actually notices, not buried in document-style text they swipe past. Users still choose whichever FD fits their liquidity needs, the point is just that they see and register that choice clearly before committing.
- **Trackable withdrawal with proactive delay handling:** Once a withdrawal is requested, the user can track it against a clear estimated time. If it runs late, Stable Money proactively explains why, gives a revised expectation, and offers a direct way to reach an agent right there, instead of the user being left to wonder or chase it down themselves.

Rohit, post-booking support breakdown

- **A single Home-screen bot with capability that grows with the relationship:** Before a user's first investment, the bot only helps with FAQs and comparing FDs or bonds, making decision-making easier without needing an agent. Once someone books their first investment, the same bot unlocks support ticket creation and feedback, handling routine queries itself and handing off to a human agent only when the issue is genuinely complex, the same pattern Flipkart uses. If a text exchange doesn't resolve it, the bot automatically raises a callback request and keeps retrying every 3 hours until a human actually connects, so nothing sits silently unresolved the way it does today.

Priya, reliability and performance decay

- **A lite mode for the important stuff:** If someone's on a weak network, using an older phone, or has just hit a couple of errors in a row, the app should automatically switch the essentials, checking FD status, maturity date, withdrawing money, into a simple, stripped-down version that just works. Bonds and the FD-card can stay as they are for

everyone else, but nobody should get locked out of the basics because of a bad connection or a struggling device.

- **Resume where you left off, and always tell them what happened:** If a transaction gets interrupted, let the user pick up exactly where they were instead of starting over. And if something fails without a clear outcome, say so plainly: if money was debited, reassure them it'll return to the same source shortly; if it wasn't, let them just continue from the payment page. Either way, the user should never be left guessing.

Suresh, trust verification gap

- **A trust banner on each specific bank, not just the platform:** Right on that bank's FD listing, show how many Stable Money users have already invested with that particular bank, along with its government registration and approval details, RBI licensing, DICGC coverage, and so on. Right now, the trust messaging is about Stable Money as a whole; this puts the reassurance directly on the exact bank the user is hesitating over.
- **Social proof matched to the user's own profile:** Stable Money already collects city, income bracket, and occupation at onboarding but only uses it for eligibility, not trust-building. Show something like "investors in Jaipur with a similar profile most often chose these three banks" instead of a generic 60-lakh-users banner. Relevant proof lands very differently than an abstract number.

Strong notification design and general app optimization alone could carry a good part of this without needing a dedicated new feature, better timed alerts and a smoother, faster-loading app go a long way toward the same reassurance on their own.

Prioritization Order

This section outlines the strategic mapping of identified Problem Statements to actionable product solutions. Each solution is prioritized using the RICE Framework (Reach, Impact, Confidence, Effort) to ensure a structured Product Roadmap, here's the Final Roadmap for the following:

Prioritization Table (RICE Framework)

Here's the Excel sheet link for better understanding of the whole through which I extracted the Roadmap:

[Stable Money Prioritization Table.xlsx](#)

2 Shortlisted Solutions

Of the seven solutions generated, two are being carried forward as prototypes, chosen not just for impact but because they're the most realistic to build and test in a first sprint, giving Stable Money an early, credible signal of movement on the goal before committing to heavier builds.

1. Per-Bank Trust Banner

- **Solves the primary barrier directly:** Trust and safety doubt is the strongest driver of non-return, and it shows up before any bad experience, touching nearly every first-time investor, not just the ones who ran into a problem.
- **Fastest, highest-confidence build:** Top RICE score of all seven, and most of the data it needs, bank registration, licensing, investor counts, likely already exists internally.

2. Redemption Terms Shown Upfront

- **Solves the second most universal barrier:** Liquidity anxiety sits in front of every reinvestment decision, whether or not the user has ever had a bad experience.
- **Sprint-ready by design:** Second-highest RICE score, and a scoped change to the booking flow rather than a new system, easy to design, prototype, and validate fast.

That said, two low-effort fixes alone do not make a full sprint. Both of them work by removing a reason not to come back, and neither gives the user a reason to come back. A fixed deposit is a set-and-forget product, so once the money is in, nothing naturally pulls the user into the app again. A third solution is added to create that missing trigger, and to give the sprint enough weight to produce a real signal.

3. Plan Your Next Investment

- **Asks at the best moment, and asks small:** Right after payment succeeds, a short page asks whether they want to plan the next investment, and the suggested step is a recurring deposit of a few thousand a month timed to salary credit, not another lump sum. Most first-time investors have just deployed savings they built over months, so a monthly amount is money they actually have, and it still counts as a repeat investment.
- **Gives proof before it asks again:** A fixed deposit pays nothing until maturity, so the user has no sign their money is working. Showing interest earned to date in the Passbook gives that proof within weeks, and someone who can see the first deposit growing takes far less convincing on the second.

- **Keeps working if the page is skipped:** Most users will tap past it. The Home screen then carries the same suggestion forward, shaped by their KYC details and first deposit, and a few well-timed prompts tied to salary credit bring them back at the point when money is actually available.

Together, these three go after the barriers and ensures better user engagement with the widest reach on the actual metric, at the lowest effort to build, making them the clearest first move for Stable Money's initial sprint.

User Journey & Prototyping

In this topic I covered the journey a first-time investor actually takes, the flow that journey runs on, the wireframes that turn the three shortlisted solutions into real screens, and a working prototype that can be opened on a phone. The intent was to move from written solutions to something a reader can see and use, so the thinking is judged on how it behaves rather than on how it reads. Each artifact below answers a different question, and they are meant to be read in order.

User Journey Map

The map follows one persona, a salaried 29 year old with savings sitting idle, across five stages: Discover, Compare, Commit, Hold and Return. At each stage it records the screens she passes through, what she does on them, where the experience loses her, how she feels, and the opportunity that stage opens up. Every opportunity is tagged with the solution that delivers it, so the map connects back to the prioritisation with a better understanding.

User journey map

First fixed deposit through to the repeat investment decision

Emotion-band Notation

The emotion band carries two lines:

- the journey with all three solutions in place
- the journey as it runs today

Both start at the same height because a strong rate is a strong hook. They separate at Compare, where the institution cannot be judged, and the untreated line falls away

sharply at Return, when an unexplained penalty arrives at the worst possible moment. The distance between those two lines at the final stage is the gap this case study sets out to close.

Primary Drop-Off Points

Three moments account for almost all of the drop-off, and the shortlisted solutions were chosen to mitigate them

- **Compare:** every bank is presented as a number and nothing else, so unfamiliarity reads as risk.
- **Commit:** exit rules are the last thing on her mind while the rate is in front of her, which is exactly why they surprise her later.
- **Hold:** nothing on screen shows the money working, and no reason to come back ever appears.

User Flow

If the journey map explains why the user hesitates, the flow explains where. It lays out every screen from sign-in to a booked deposit and then back to Home, in a single readable line, so it is immediately clear how few steps separate seeing a rate from making a payment. Screen numbers match the wireframe set so the two can be read together, the screens carrying a shortlisted solution are highlighted and labelled, and the dashed arrow returning to Home is the repeat visit the case study is aimed at.

Wireframes

Eighteen screens, drawn in greyscale on purpose. At this stage the argument is structure and sequence rather than visual design, so colour carries exactly one meaning: anything marked in orange is a proposed change rather than an existing screen. Every screen is connected to the next, with each arrow starting on the exact element being tapped and the interaction labelled on it, so the flow can be followed end to end without reading a single note.

Board Arrangement

The board reads in three rows, one per solution.

- **Row one:** sign-in through to the bank page, where the trust signals sit.
- **Row two:** the booking flow, ending at the terms screen.
- **Row three:** the payment animation through to the confirmation, and the updated Home and Passbook.

Explanatory callouts sit beside each screen rather than on top of it, numbered against the elements they describe.

Interactive Prototype

The prototype is a working build rather than a clickable mockup. The screens are real, the return figures are calculated rather than typed in, and the recommendation logic reads the portfolio, so what the app suggests changes as investments are added. That matters for the third solution in particular, because its whole argument is that the next step should adapt to what the user already holds instead of repeating the same prompt.

What to try

- **Trust signals:** open any bank and swipe the trust banners. Each institution carries its own frontage and its own verifiable facts, and comparing a small finance bank against an NBFC shows the last card change from insured to not insured.
- **Terms upfront:** book a deposit and stop at the terms step. The full agreement comes first, then five key points, each with its own tick and an option to expand, so the exit penalty is stated in plain arithmetic before payment rather than after it.
- **Plan the next investment:** complete the payment. The success animation resolves into the receipt and the lower third offers the next investment. Take it or skip it, then open Home and the Passbook and find the same suggestion waiting.

<https://stable-money-prototype.himanshu-etc1.workers.dev>

Note: Any ten digit number signs in and any six digits work as the OTP. Nothing is stored, so a refresh returns the app to a signed out state.

Go-to-Market Strategy & Business Impact

GTM Strategy

Each solution targets one specific moment where users stall, not a generic update pushed to everyone.

Solution	Target Segment	Value Proposition	Channel
Trust signals	First-time investors comparing FDs across unfamiliar banks	Before: just a name and a rate. After: a frontage, verified backers, and a clear insurance status, visible at a glance.	In-app, on the bank and bond screens
Terms upfront	Users about to pay, who haven't seen the exit terms yet	Before: exit terms sit elsewhere, unread. After: shown in two short screens before payment, penalty stated in plain numbers.	In-app, between Nominee and Payment
Plan your next investment	Users right after their first booking	Before: the app goes quiet after booking. After: one small next step appears on the receipt, then follows on Home and Passbook.	In-app, on the success screen, then Home and Passbook

Assumptions worth flagging:

- **Trust signals** assumes users actually stop to read the banners rather than swiping past. Worth checking in the first data window, not assumed.
- **Terms upfront** assumes legal clears the simplified five-point language without needing a full redesign, since that would delay its review.
- **Plan your next investment** assumes a recurring deposit feels small, not like a second sales pitch right after payment. This is the riskiest assumption of the three.

Release Motion

None of these three get an external announcement, an email, or a press moment. That kind of launch fits a brand-new product, not an improvement to a screen users already use.

- **Trust signals** and **Terms upfront** ship silently. They should feel like a natural upgrade to something already familiar, not a launch.
 - **Plan your next investment** is the one exception. It introduces something genuinely new, so a small "**New**" tag on its first appearance, gone after the user has seen it twice, earns it a first look without pushing it.
-

Cohort Rollout

Exposure ramps in stages rather than reaching every user at once, so a problem surfaces while it's still small enough to fix quietly.

Solution	10%	50%	100%
Trust signals	Day 14	Day 17	Day 21
Terms upfront	Day 31	Day 34	Day 37
Plan your next investment	Day 50	Day 53	Day 56

Every stage is a configuration change, not a redeploy, so exposure can drop back to zero the moment booking completion falls or crash rate rises, without waiting on an engineering release cycle.

Post-Business Impact Analysis

- **Strategic alignment.** Stable Money earns money each time a deposit is placed, not each time someone signs up. So the real business lever isn't how many people download the app, it's how many times an existing user comes back and deposits again. This sprint is aimed directly at that lever.
- **Customer value.** Right now, most users treat the app like a one-time rate comparison tool: they book once and never come back, because nothing after that first deposit gives them a reason to. These three changes fix the actual points where trust breaks down, an unfamiliar bank, exit terms they never saw, and replace the silence afterward with one clear next step. The user gets less anxiety, fewer surprises, and an app that's still useful after the first transaction.
- **Revenue and growth.** Recurring deposit already existed in the app before this sprint. What didn't exist was a moment that told a user it was there and worth starting small. This isn't a new product, it's fixing a feature that was already built but going unused. That makes it one of the cheapest ways to grow revenue

available right now, since no new engineering is needed to build the thing, only to surface it at the right moment.

- **Competitive positioning.** Most FD marketplace apps compete only on the rate they display. None of them currently show who the institution actually is or explain exit terms before payment. As rates across these apps get closer to each other, that gap becomes the reason someone picks Stable Money over the others, not the number on the screen.
 - **Risk of not building.** Without this, Stable Money keeps paying to bring in users who compare once, book once, and disappear. A penalty that surprises someone after the fact becomes a bad review instead of a moment the app got ahead of. And recurring deposit keeps sitting in the app, built, working, and going unnoticed.
-

Metrics & Success Measurement

This section defines how success is measured: the OKRs the sprint is ultimately judged on, the supporting signals that show the strategy is working before that number moves, the safeguards that catch it going wrong, and what needs to be tracked to see any of it.

North Star Metric

90-Day Repeat Transaction Rate: the % of first-time FD investors who complete a second investment within 90 days of their first booking.

Baseline	Target
20%	35%, within 6 months

Level 1 Metrics

Metric	Definition	Baseline	Target
Activation Rate	% of users who start KYC and complete their first booking	62%	68%
Week 4 Retention Rate	% of the first-time investor cohort still transacting 30 days after their first booking	35%	48%
Feature Adoption Rate	% of eligible users who engage with the next-step recommendation	No baseline (new feature)	60%+
DAU/MAU (Stickiness)	Ratio of daily to monthly active users among first-time investors	8%	12%
ARPU	Average referral revenue per first-time investor over 90 days	Baseline index 1.0x	1.3x baseline

Level 2 Metrics

Leading indicators under each Level 1 metric.

Metric	Supports	Definition	Baseline	Target
Funnel Conversion Rate (Terms step)	Activation Rate	% of users who reach Payment after starting the Terms step	88%	90%+

Metric	Supports	Definition	Baseline	Target
Click-Through Rate (Trust banner)	Feature Adoption Rate	% of banner impressions with a 2+ second engagement	No baseline (new feature)	70%
Time to Value (TTV)	Week 4 Retention	Days from first booking to second booking	55–60 days	Under 30 days
Churn Rate (Recurring Deposit)	ARPU	% of started RDs cancelled within 30 days	No baseline (new feature)	Under 10%
Purchase Frequency	ARPU	Average number of investments per first-time user in 90 days	1.2	1.5

Note: I don't have access to Stable Money's actual product analytics, so every baseline above is a close approximation based on how an app like this typically behaves & a bit of research, not real data

Guardrail Metrics

Each of these protects against the North Star moving up while something else quietly breaks underneath it.

Guardrail	Threshold	Why It Matters
Funnel Drop-off Rate (booking flow)	Must not increase	If fewer people finish a booking after seeing the new terms screen, the disclosure is scaring people off instead of reassuring them
NPS	Must not decline	A rising repeat rate paired with unhappier users means the nudges feel pushy, not helpful
Churn Rate (Recurring Deposit)	Must stay under 15%	A high cancel rate means people said yes without meaning to, not a real win even if it lifts the number short term
Support Ticket Volume (exit terms or penalties)	Must not increase	More confused users contacting support means the plain-language explanation isn't actually landing

Event Tracking Specification

Event	Fires When	What It Tells Us	Feeds Into
Trust banner viewed	A trust signal stays on screen for 2+ seconds	Whether the user actually noticed it, not just scrolled past it	Click-Through Rate, Feature Adoption Rate
Terms step completed	User finishes reading a terms step	Whether the disclosure is being read, not skipped	Funnel Conversion Rate
Booking completed	Payment succeeds	Whether this is a user's first or repeat investment	North Star Metric, Activation Rate, Purchase Frequency
Next step shown	The recommendation card appears on screen	Whether users are actually being offered a next step	Feature Adoption Rate
Next step actioned	User taps the recommendation	Whether the recommendation is working, not just present	Feature Adoption Rate, Week 4 Retention Rate
Recurring deposit started	A recurring deposit is confirmed	Whether the RD nudge is converting into real signups	Churn Rate, ARPU, Purchase Frequency

Risks, Trade-Offs & Constraints

This section covers three things:

what could realistically stop these solutions from working

what was deliberately given up to make them work, and the outside limits, regulatory and technical, that shaped the first version. None of this is meant to sound cautious for its own sake, it's the difference between a plan that looks good on paper and one that's actually been stress-tested.

Risk Assessment

Every recommendation layer added to a financial app carries risk in more than one direction, not just the compliance kind. The five below risks what all to keep eyes on even if the solutions are right on the nail, afterall risks are wide-ranging.

Type	Risk	Why It Matters	Mitigation
Product	Recommendation gets ignored (banner blindness)	Fintech apps are full of nudges already; if users swipe past anything that looks promotional, the North Star gets no input at all	Tie it to the user's actual portfolio, not a generic offer, so it reads as personal, not promotional
Technical	Portfolio read is stale or wrong	Recommending something a user already holds breaks trust at the exact moment the feature exists to build it	Recommendation reads live state at render time, never a cached snapshot
Regulatory	Nudge triggers suitability rules	RBI's incoming mis-selling framework targets exactly this kind of repeated, incentive-linked nudging	Strictly opt-in, one prompt per surface, never re-shown after a decline
Market	Partner banks change terms faster than content updates	Outdated bank data misleads instead of reassures, undermining the entire premise of Compare	Refresh cadence written into the partner agreement, not a one-time sync
Business	North Star goes up while deposit value goes down	The recommendation defaults to a small recurring deposit as the easiest next step. If users take that path instead of a second FD or bond, the	Track average deposit value per repeat investor alongside the repeat rate itself, and let the recommendation suggest a second FD or bond first

Type	Risk	Why It Matters	Mitigation
		repeat rate improves on paper, but total deposit volume, and the referral revenue tied to it, could shrink, since an RD's ticket size is a fraction of a typical FD	when the user's own transaction size suggests they can afford one, defaulting to RD only when that's realistic
None of these are unique to Stable Money, they're the standard cost of adding a recommendation layer to a financial app. The mitigations above are what keeps that cost small.			

Trade-off Analysis

Conflict	What I Chose	Why
More banks vs. Verified banks	Verified banks: on the bank and bond detail screens: trust signals go live only for the initial, manually checked partner batch	A wrong trust claim undoes the exact confidence this feature exists to build, and accuracy is now a compliance line, not a nice-to-have
Strong nudge vs. Safe nudge	Safe nudge: on the success screen, then passively on Home and Passbook: shown once, never repeated after a decline	The incoming suitability rules target repeated nudging directly, a softer prompt is the safer trade even at a lower immediate conversion
Fast launch vs. Clear results	Clear results: across all three solutions: one ships and is measured before the next follows	Without staggering, a lift in the North Star can't be traced to a specific idea, which matters more here than speed to full impact

Worth Revisiting

- The bank-verification trade-off is a first-version limit, not permanent, worth revisiting once the partner list grows past its initial batch.
- The nudge design deserves a second look once RBI's suitability rules are finalized in January 2027, since the bar for acceptable may move.

Why Stable Money Should Consider My Solutions

This plan doesn't ask for belief, it's built on where users actually drop off, what it costs the business to fix that, and how it's checked so the fix holds up.

- **It fixes the actual reason users don't come back, not a guess.** Each solution maps to a specific point where trust breaks down: an unfamiliar bank at Compare, unclear exit terms at Commit, silence after the first deposit at Hold. Nothing here is a generic engagement feature bolted on, every piece answers a failure that's already been traced in the journey map.
- **It grows revenue from users already paid for, at no added acquisition cost.** Stable Money earns the same referral fee on a repeat booking as a first one, so a higher repeat rate is close to pure margin, not a cost competing for budget against new-user growth.
- **It only counts as a win if users stay happy too.** Every solution is checked against safety numbers like NPS and support complaints alongside the repeat rate itself. If the repeat rate rises but users grow less satisfied, that's treated as a problem, not a success, so the improvement this plan produces is a real one, not one that quietly costs something elsewhere.

Expected Metric Improvement

Metric	Current	Expected
90-Day Repeat Transaction Rate	20%	35%
Activation Rate	62%	68%
Week 4 Retention Rate	35%	48%
ARPU	1.0x baseline	1.3x baseline

***90-Day Repeat Transaction Rate:** the North Star metric, % of first-time investors who make a second investment within 90 days.

***Activation Rate:** % of users who start signing up and actually complete their first booking.

***Week 4 Retention Rate:** % of first-time investors still transacting 30 days after their first booking.

***ARPU:** Average Revenue Per User, how much Stable Money earns per investor over the 90-day window.
